REBUTTAL TESTIMONY

OF

NICK WINTERMANTEL

January 13, 2020

**NMPRC CASE NO. 19-00195-UT
INDEX TO THE REBUTTAL TESTIMONY OF
NICK WINTERMATEL**

**WITNESS FOR
PUBLIC SERVICE COMPANY OF NEW MEXICO**

I.	INTRODUCTION	1
II.	RESPONSE TO CCAE’S DIRECT TESTIMONIES	4
III.	RESPONSE TO SIERRA CLUB’S DIRECT TESTIMONY	13
IV.	RESPONSE TO SWG’S DIRECT TESTIMONY	23
V.	CONCLUSION.....	25

AFFIDAVIT

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1

I. INTRODUCTION

2 **Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

3 **A.** My name is Nick Wintermantel, and my business address is Astrapé Consulting
4 (“Astrapé”), 1935 Hoover Court, Hoover, Alabama, 35226.

5

6 **Q. HAVE YOU PREVIOUSLY FILED TESTIMONY IN THIS CASE?**

7 **A.** Yes, I submitted direct testimony on July 1, 2019 and direct errata testimony on
8 September 20, 2019.

9

10 **Q. PLEASE SUMMARIZE YOUR REBUTTAL TESTIMONY**

11 **A.** My rebuttal testimony responds to testimony from the intervenors addressing
12 Public Service Company of New Mexico’s (“PNM” or “Company”) SERVM
13 modeling for this case. Specifically, I respond to testimony submitted by the
14 Coalition for Clean Affordable Energy (“CCAЕ”), the Sierra Club, and Southwest
15 Generation Operating Company, LLC (“SWG”). I make an effort to respond to
16 all of the intervenors’ testimony regarding SERVM. However, if I do not address
17 a particular point by an intervenor in my rebuttal, it should not be construed as
18 PNM’s agreement with the intervenor on that point.

19

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 **Q. WHAT BENEFITS DOES THE SERVM ANALYSIS PROVIDE PNM'S**
2 **RESOURCE PLANNING ANALYSIS?**

3 **A.** SERVM provides intra-hour modeling and the capability to determine reliability
4 from a capacity and flexibility standpoint in addition to providing economics.
5 With a growing level of renewable resources on PNM's system, it is important to
6 calculate reliability based on chronological commitment and dispatch that also
7 takes into account unit generator constraints and resource characteristics of the
8 renewable fleet under a wide range of weather, load, and unit performance
9 uncertainties. Analyzing only average conditions provides a limited indication of
10 system reliability. By modeling intra-hour time steps, the SERVM modeling also
11 captures the reliability and efficiency benefits of more flexible resources and the
12 ramping needs caused by variable energy resources.

13
14 **Q. AFTER REVIEWING THE DIRECT TESTIMONIES SUBMITTED BY**
15 **INTERVENORS, DO YOU STILL SUPPORT PNM SCENARIO 1?**

16 **A.** Yes. PNM Scenario 1 provides PNM's customers with the best mix of
17 replacement resources to meet system reliability at a reasonable cost. PNM
18 Scenario 1 makes use of the best in class resources across several technologies
19 and provides additional diversity benefit to customers.

20

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 **Q. IS THE PINON GAS PLANT AN ESSENTIAL ELEMENT OF PNM**
2 **SCENARIO 1?**

3 **A.** Yes. As shown in PNM Table NW-6 and NW-7 in my Direct Testimony, the
4 Pinon Gas Plant was part of the optimal replacement portfolio in the SERVUM
5 model analysis regardless of whether any limitation was applied on batteries. The
6 Pinon Gas Plant provides an economic capacity option to ensure reliability during
7 periods of low renewable output and also provides flexibility to integrate future
8 renewables.

9
10 **Q. WILL PNM BE ABLE TO PROVIDE RELIABLE SERVICE AT A**
11 **REASONABLE PRICE WITHOUT INCLUDING THE PINON GAS**
12 **PLANT IN ITS REPLACEMENT RESOURCE PORTFOLIO?**

13 **A.** I do not believe so. I disagree with the assertions to the contrary made by CCAE
14 and Sierra Club witnesses. As I explain in greater detail later in my rebuttal
15 testimony, CCAE witness Michael Milligan used flawed modeling assumptions in
16 his analysis. Even with these flawed assumptions, PNM Scenario 1 is more
17 reliable and lower-cost than CCAE's recommended portfolios. For its part, Sierra
18 Club suggests several alternative replacement resource portfolios in Michael
19 Goggin's direct testimony, but none of these portfolios are as economic as PNM
20 Scenario 1 when taking into account reliability and technology risk.

21

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

II. RESPONSE TO CCAE'S DIRECT TESTIMONIES

19
20
21

Q. TO WHAT PORTIONS OF CCAE'S DIRECT TESTIMONIES ARE YOU RESPONDING?

A. I respond to Dr. Michael Milligan's Direct Testimony on behalf of CCAE that addresses CCAE's SERVM modeling inputs. I also respond to Dr. Milligan's criticism of SERVM's LOLE_{FLEX} metric.

Q. WHAT RELIABILITY ASSUMPTIONS DID CCAE MAKE IN ITS SERVM ANALYSIS?

A. CCAE's modeling includes three substantial and unreasonable changes to the assumptions PNM used in its SERVM reliability analysis. These assumption changes are not reasonable for modeling purposes because they artificially improve system reliability across every replacement resource portfolio modeled by CCAE. CCAE's first unreasonable assumption is a decrease in the equivalent forced outage rate ("EFOR") for Four Corners Generating Station ("Four Corners") Units 4 and 5 from 20% to 8.9%.¹ The second is a change to the import limit modeling by increasing the import capability to a constant 300 MW from the 200 MW to 300 MW distribution modeled by Astrapé and the Company.² The third is a 42 MW increase in energy efficiency ("EE") and demand response ("DR") capability beyond what PNM is forecasting will be available in 2023.³

¹ Milligan Direct at 7-8.

² Milligan Direct at 6-7.

³ Milligan Direct at 5-6.

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 **Q. WHY IS CCAE'S ADJUSTMENT TO THE FOUR CORNERS UNITS 4**
2 **AND 5 EFOR FROM 20% TO 8.9% UNREASONABLE?**

3 **A.** The 8.9% used by CCAE is unreasonable because it is based on a North American
4 Electric Reliability Corporation ("NERC") average that does not reflect actual
5 historical performance of Four Corners Units 4 and 5. As PNM witness Nicholas
6 Phillips explains in more detail in his rebuttal testimony, PNM's 20% assumption
7 is more appropriate for modeling purposes because it is based on a three-year
8 historical average, from 2016 to 2018, of actual Four Corners' performance
9 adjusted for known improvements. Four Corners Units 4 and 5 demonstrated an
10 EFOR greater than 20% in each of these three years.

11

12 **Q. WHAT ASSUMPTIONS REGARDING IMPORT LIMITS DURING PEAK**
13 **LOAD PERIODS DID ASTRAPÉ MODEL?**

14 **A.** Astrapé assumed that PNM could meet up to 15% of its peak load (300 MW /
15 2,000 MW peak) from neighboring systems to assist in avoiding loss of load
16 events. Astrapé modeled the 300 MW maximum import limit during peak periods
17 as a uniform distribution, which ranged from 200 MW – 300 MW when load was
18 higher than 85% of the peak forecast. The values included in the distribution
19 were 200 MW, 225 MW, 250 MW, 250 MW, 275 MW, and 300 MW. The
20 SERVIM model randomly drew from the distribution when load was higher than
21 85% of the forecasted peak load to limit opportunity purchases from external
22 neighbors. For the majority of hours when loads were below 85%, the maximum

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 constraint was 5,000 MW, which essentially meant there was no constraint
2 applied outside of the normal transmission topology.

3
4 PNM provided these modeling assumptions, and all other modeling assumptions
5 supporting the SERVVM analysis, to intervenors through discovery by providing
6 intervenors access to the models themselves and by hosting informal modeling
7 meetings for parties to ask PNM questions about the modeling software and
8 assumptions.

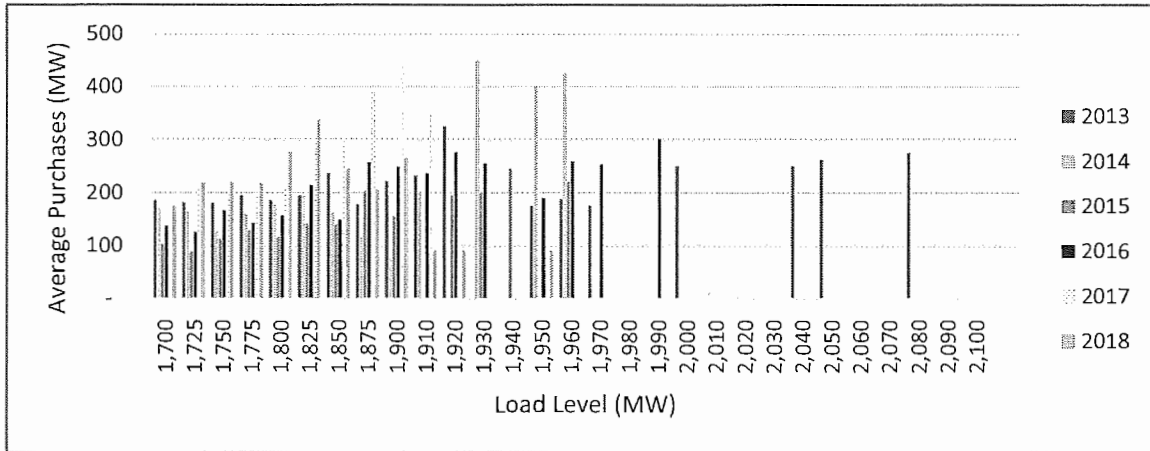

9
10 **Q. WHAT IS YOUR RESPONSE TO CCAE'S CLAIM THAT A CONSTANT**
11 **IMPORT LIMIT OF 300 MW SHOULD BE ASSUMED FOR ALL PEAK**
12 **HOUR PURCHASES IN THE SERVVM MODELING?**

13 **A.** CCAE's assumption is unreasonable because it is not consistent with the
14 historical data provided by PNM. The following two charts, which were provided
15 to the parties in discovery, show historical market purchases during peak load
16 hours and high market price hours. The historical data clearly shows that during
17 peak periods PNM has not always purchased 300 MW. The historical data further
18 shows it is reasonable to cap the maximum import capability during peak periods
19 at 300 MW and capture a range of purchases from 200 MW to 300 MW as
20 modeled in SERVVM.

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1

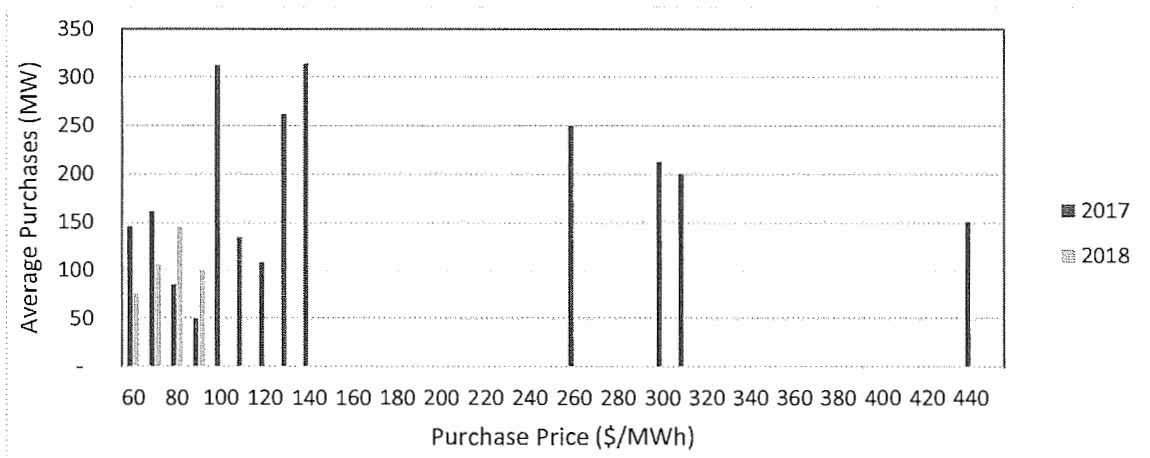

PNM Chart NW-1 (Rebuttal)

2

3

PNM Chart NW-2 (Rebuttal)

4

5 **Q. PLEASE EXPLAIN FURTHER HOW ASTRAPÉ DERIVED THE**
6 **IMPORT ASSUMPTION USED IN THE SERVVM MODELING.**

7 **A.** Astrapé reflected PNM’s recommended transmission limit of 150 MW for day
8 ahead purchases and up to 150 MW of hourly non-firm purchases for a maximum
9 limit of up to 300 MW by modeling the transmission limit between 200 MW to
10 300 MW. The day ahead purchase capability was always included and the hourly

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 non-firm purchases were captured at 50 – 150 MW. This appropriately captures
2 the stochastic nature of hourly real-time purchase capability as supported by
3 PNM.

4
5 **Q. IS THERE ANY GUARANTEE THAT PNM WILL BE ABLE TO RELY**
6 **ON ANY AMOUNT OF EXTERNAL MARKET PURCHASES IN THE**
7 **FUTURE?**

8 **A.** No. As explained in greater detail by PNM Witness Steven Maestas, market
9 purchases are not a reliable resource option to meet required NERC reliability
10 standards because the availability and deliverability of power in the market is
11 uncertain. Further, as also discussed by PNM Witness Maestas, market liquidity
12 and depth has declined over time, providing further evidence around the
13 uncertainty of future market purchase capability. While PNM is part of a larger
14 interconnection and there is expected to be some market assistance benefit,
15 PNM's surrounding utilities do not conduct planning in order to meet PNM's
16 peak load and have no obligation to serve PNM's load. It is PNM's responsibility
17 to plan for and maintain its own reliability as the Balancing Authority. While
18 system operators make use of interconnections on a daily basis, there is no
19 guarantee the capacity will be there during PNM's peak need.

20
21 Because of this uncertainty, Astrapé and PNM's modeling import assumption is,
22 if anything, optimistic, as also discussed by PNM Witnesses Dorris and Maestas.

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 In any event, it would not be reasonable to increase the modeled import
2 assumption as CCAE suggests.

3
4 **Q. HAS ASTRAPÉ PERFORMED SENSITIVITY ANALYSES TO**
5 **DETERMINE HOW IMPORT LIMIT ASSUMPTIONS IMPROVE**
6 **RELIABILITY?**

7 **A.** Yes. Astrapé performed a SERVVM sensitivity that removed all market assistance
8 in its reliability modeling to understand the impact. This sensitivity demonstrates
9 that the market assistance assumptions utilized by PNM already greatly improve
10 reliability. PNM's Scenario 1 LOLE_{CAP} in 2023 increases from 0.17 events per
11 year to 3.0 events per year if all external balancing authority assistance is
12 removed from the modeling. While Astrapé does not believe it is appropriate to
13 remove all market assistance, it is clear that the assumptions used by Astrapé
14 already provide substantial market assistance benefit and should not be stretched
15 further as CCAE recommends. Stretching these assumptions further would be
16 irresponsible from a reliability planning perspective and increase risks for system
17 operators within the PNM Balancing Area.

18
19 **Q. HAS THE NORTH AMERICAN RELIABILITY CORPORATION**
20 **(“NERC”) CONDUCTED LONG TERM RELIABILITY ASSESSMENTS**
21 **REGARDING ANTICIPATED RESERVE MARGINS IN THE**
22 **SOUTHWEST REGION OF THE COUNTRY?**

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 **A.** Yes. The 2019 NERC reports show reserve margins in the southwest region are
2 currently at 20% and are expected to decrease to 16.8% by 2023 and 14.5% by
3 2024.⁴

4
5 **Q.** **WHAT DO THESE DECREASES IN RESERVE MARGINS SUGGEST**
6 **ABOUT PNM'S FUTURE PURCHASE CAPABILITY DURING PEAK**
7 **LOAD PERIODS?**

8 **A.** The lower reserve margins in 2023 for the southwest region suggest that market
9 purchase capability in the future will be less than historical market purchase
10 capability. With the expectation of lower reserve margins, PNM's modeled
11 import limit, which reasonably corresponds to historical data, should not be
12 increased.

13
14 **Q.** **WHAT ENERGY EFFICIENT ("EE") AND DEMAND RESPONSE ("DR")**
15 **ASSUMPTIONS DID CCAE MAKE IN ITS RELIABILITY MODELING?**

16 **A.** CCAe modeled an incremental assumption of approximately 12 MW of EE and
17 31 MW of DR in its SERVVM reliability modeling for 2023. These assumptions,
18 which are discussed in detail by PNM Witness Phillips, artificially lower PNM's
19 peak load by approximately 42 MW in the modeling and overstate reliability for
20 every replacement resource combination.

21

⁴ https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_LTRA_2019.pdf at page 41.

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 **Q. WOULD THE RESOURCE PORTFOLIOS PRESENTED BY CCAE BE**
2 **RELIABLE WITHOUT MAKING CCAE’S UNREASONABLE CHANGES**
3 **TO THREE KEY ASSUMPTIONS IN THE MODEL?**

4 **A.** No. PNM obtained CCAE’s modeling inputs in discovery. Using those inputs,
5 Astrapé simulated the CCAE 1 Portfolio presented in the Direct Testimony of
6 Anna Sommer with the original Four Corners EFOR assumption of 20%, the
7 PNM forecasted EE and DR assumptions, and the import limit modeled as a
8 distribution of 200 MW to 300 MW. With these original assumptions, the 2023
9 $LOLE_{CAP}$ of the CCAE 1 Portfolio increases from 0.14 events to 0.63 events per
10 year. Under the original assumptions used by PNM, this 0.63 events per year for
11 the CCAE 1 Portfolio compares to 0.17 events per year for PNM Scenario 1.

12
13 **Q. ARE CCAE’S PORTFOLIOS AS ECONOMIC AS PNM SCENARIO 1?**

14 **A.** No. In its direct testimonies, CCAE presented economic analysis performed only
15 in EnCompass, and not in SERVVM. Considering just the analysis from
16 EnCompass and incorporating CCAE’s flawed assumptions, PNM Scenario 1 is
17 not only more reliable but also more economic than the replacement resource
18 combinations CCAE developed. In order to ensure the CCAE portfolio is
19 reliable, additional capacity must be added to the portfolio, which would increase
20 CCAE’s portfolio cost even further and make PNM Scenario 1 even more
21 economical in comparison.

22

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 **Q. TURNING NOW TO LOLE_{FLEX}, PLEASE EXPLAIN ITS BENEFITS AND**
2 **WHY A FLEXIBILITY METRIC SUCH AS LOLE_{FLEX} IS IMPORTANT**
3 **FOR RELIABILITY PLANNING.**

4 **A.** LOLE_{FLEX}, as developed by Astrapé, provides a reasonable means of comparing
5 system flexibility across different portfolios. LOLE_{FLEX} measures the electric
6 system's ability to meet net load obligations in the next five minutes given perfect
7 foresight. In other words, LOLE_{FLEX} shows whether the system has enough
8 flexibility to meet a known five-minute net load ramp. With the significant
9 addition of variable energy resources on PNM's system, it is important that
10 planners ensure the system has sufficient flexibility to meet reliability needs. As
11 PNM adds more variable resources to its system over time, a metric such as
12 LOLE_{FLEX} will become increasingly important in resource planning. Mr. Phillips
13 further explains the benefits of LOLE_{FLEX} analysis in his rebuttal testimony.

14

15 **Q. DO YOU AGREE WITH DR. MILLIGAN'S CRITIQUES OF LOLE_{FLEX}?**

16 **A.** No. Dr. Milligan's critiques overstate the significance of LOLE_{FLEX} in PNM's
17 portfolio analysis. Each of the replacement portfolios PNM modeled with flexible
18 gas or batteries can meet the LOLE_{FLEX} of 0.2 events per year. In general,
19 resource portfolios with quick start gas and/or storage units, such as PNM
20 Scenario 1, can manage the unexpected ramps in variable energy resources in an
21 efficient manner and demonstrate an LOLE_{FLEX} of 0.2 events per year or better.
22 The more binding reliability metric in PNM's analysis was LOLE_{CAP}; the PNM
23 scenarios that do not provide adequate reliability fail because they do not meet the

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 LOLE_{CAP} threshold of 0.2 events per year. LOLE_{CAP} measures capacity shortfalls
2 and meeting this criterion ensures PNM has sufficient capacity to meet peak
3 demand periods during its first step under the Energy Transition Act.

4
5 In addition, Dr. Milligan draws an incorrect comparison between LOLE_{FLEX},
6 which is calculated in the SERV_M planning tool with 5-minute ahead perfect
7 foresight, with real time area control error (“ACE”) deviations, which result from
8 system operators constantly trying to balance net load on a second by second
9 basis.⁵ Real time ACE deviations will always be far greater in frequency and
10 magnitude than LOLE_{FLEX} violations as calculated in SERV_M. Dr. Milligan
11 acknowledged in discovery, in response to PNM interrogatory 1-16, that SERV_M
12 does not calculate ACE deviations. Accordingly, Dr. Milligan’s comparison of
13 ACE deviations with LOLE_{FLEX} should be rejected.

14
15 **III. RESPONSE TO SIERRA CLUB’S DIRECT TESTIMONY**

16 **Q. TO WHAT PORTIONS OF SIERRA CLUB WITNESS MICHAEL**
17 **GOGGIN’S TESTIMONY ARE YOU RESPONDING?**

18 **A.** I am responding to the following claims made by Sierra Club Witness Goggin:

- 19
- 20 • PNM did not account for how the energy imbalance market (“EIM”) will
reduce its flexibility requirements;⁶
 - 21 • the 200 MW to 300 MW import limit is not reasonable;⁷

⁵ Milligan Direct at 9-10.

⁶ Goggin Direct at 21-22.

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

- 1 • PNM did not fully account for the impact of technology improvements in
2 renewable generation profiles;⁸
- 3 • PNM did not account for conventional generators deviating from their
4 scheduled output;⁹
- 5 • SERVVM relied entirely on fast-acting spinning reserves and did not make use
6 of non-spinning reserves to accommodate renewable variability;¹⁰
- 7 • “batteries appear not to have been fully valued because SERVVM and other
8 tools do not have sufficient chronological modeling resolution to recognize
9 benefits of extremely fast response.” Sierra Club Witness Goggin also claims
10 PNM never considered grid charging on hybrid solar-storage modeling which
11 could improve reliability;¹¹
- 12 • PNM overstated the reliability of gas due to not modeling correlated gas
13 outages;¹² and
- 14 • flexibility and capacity shortfalls modeled in SERVVM will not necessarily
15 result in loss of load events.¹³
- 16

⁷ Goggin Direct at 24-26.

⁸ Goggin Direct at 29-30.

⁹ Goggin Direct at 30-31.

¹⁰ Goggin Direct at 31.

¹¹ Goggin Direct at 35-37.

¹² Goggin Direct at 41-49.

¹³ Goggin Direct at 39-41.

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 **Q. PLEASE RESPOND TO MR. GOGGIN'S CLAIM THAT THE IMPORT**
2 **LIMIT WAS TOO LOW.**

3 **A.** As I explained above in my response to CCAE, Astrapé developed the import
4 limit assumptions based on historical purchase data and PNM's recommendations.
5 It is important that PNM not overstate market assistance in order to accurately
6 model system reliability. Despite this, Sierra Club Witness Goggin quotes
7 specific market purchase values greater than 300 MW during hours when demand
8 was above 1,850 MW of load and market prices were above \$100/MWh.
9 However, the hours Mr. Goggin cites represent only seven hours across two days
10 and are not representative of the historical data. The chart below, PNM Chart
11 NW-3 (Rebuttal), shows all market prices above \$100/MWh in the dataset
12 provided by PNM in discovery. The chart provides further evidence that
13 Astrapé's distribution of 200 MW – 300 MW is reasonable and, in fact, may be
14 optimistic given the uncertainty of whether market purchases will be available in
15 the future.

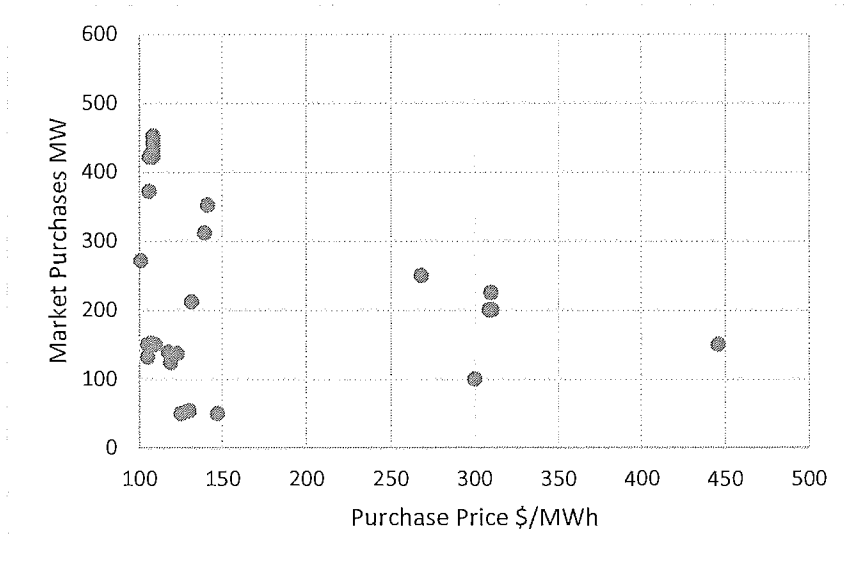

16

17

4

5

6

7

8

9

10

11

Mr. Goggin also points to PJM’s reliance on external neighbor assistance¹⁴ in its modeling. PJM is a regional transmission organization (“RTO”) that is part of the Eastern interconnection grid, and as the nation’s largest RTO provides transmission service across thirteen states and the District of Columbia. In fact, PJM’s modeling is very similar to PNM’s own modeling because PJM limits market imports at 3,500 MW,¹⁵ which is below the physical transmission capability and equal to 2.3% of the peak load (3,500 MW/150,000 MW). PJM uses the assumption during all hours in its modeling, not just during peak hours. As a result, PJM counts on substantially less external capacity as a percentage of

¹⁴ Goggin Direct at 27.

¹⁵ <https://www.pjm.com/-/media/committees-groups/subcommittees/raas/20181004/20181004-pjm-reserve-requirement-study-draft-2018.ashx> at 32

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 peak load (2.3%) in modeling than PNM, which counted on up to 15% of peak
2 load (300 MW/2,000 MW).

3
4 **Q. PLEASE RESPOND TO SIERRA CLUB WITNESS GOGGIN'S**
5 **CRITIQUE OF PNM'S CONSIDERATION OF THE EIM IN ITS SERVUM**
6 **MODELING.**

7 **A.** As discussed by PNM Witness Maestas in more detail, as a balancing authority
8 PNM is responsible for supplying its own capacity to meet load, ramping and
9 reserve requirements and will be prohibited from leaning on other EIM
10 participants for capacity needs. Accordingly, Mr. Goggin's critique that PNM
11 should have relied on the EIM for capacity in its modeling should be rejected.

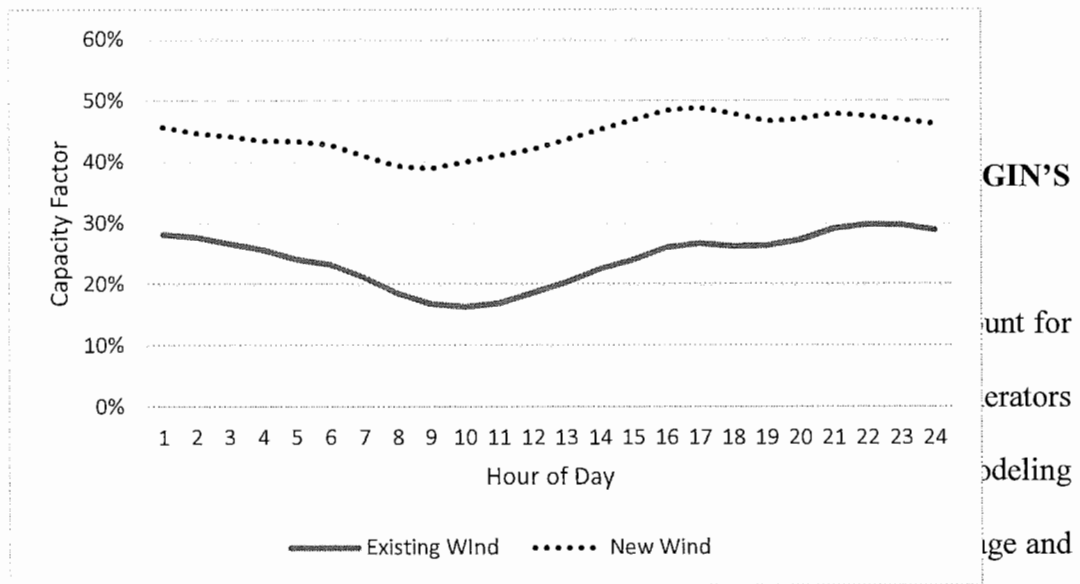

12
13 As I discussed above, SERVUM modeling extensively, and optimistically, captures
14 market assistance and diversity benefits from PNM's interconnections with other
15 utilities and sees a significant reduction in LOLE_{CAP} as a result of these benefits.
16 LOLE_{CAP} is reduced from 3.0 events per year down to 0.17 events per year when
17 the interconnections are modeled for PNM Scenario 1. From a flexibility
18 standpoint, renewable curtailment is reduced by almost 50% by capturing the
19 market assistance in SERVUM.

20
21 **Q. PLEASE RESPOND TO SIERRA CLUB WITNESS GOGGIN'S**
22 **CRITIQUE OF RENEWABLE OUTPUT PATTERNS IN THE SERVUM**
23 **MODELING.**

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 **A.** Sierra Club Witness Goggin provides no analysis to support his claim that the
2 renewable patterns in SERVVM do not take into account technological
3 advancements. In fact, the following chart, PNM Chart NW-4 (Rebuttal), shows
4 average wind shape based on the data provided by PNM to the parties in
5 discovery for existing and new wind resources. The figure clearly shows that the
6 hourly output for new wind resources is higher in all hours and that the relative
7 outperformance is even more noticeable during lower wind output hours such as
8 hours 8-12.

PNM Chart NW-4 (Rebuttal)

10 **Q.**

11 **A.**

12
13
14
15
16
17 full outages, startup times, ramp rates, and minimum up and down times similar to
18 what system operators would see in real time operations. Sierra Club Witness
19 Goggin has supplied no evidence that PNM conventional generators significantly
20 deviate from their scheduled output.

21

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 Further, after reviewing the material cited by Sierra Club Witness Goggin in his
2 direct testimony, Astrapé found no additional evidence that dispatchable
3 generation should be modeled with additional deviations. In fact, a portion of the
4 PacificCorp study relied on by Witness Goggin stated the opposite:

5 In the Regulation Reserve Study, resources that provide contingency or
6 regulation reserve are considered a separate, dispatchable resource class.
7 The dispatchable resource class compensates for deviations resulting from
8 other users of the transmission system in all hours. While non-
9 dispatchable resources may offset deviations in Loads and other resources
10 in some hours, they are not in the control of the system operator and
11 contribute to the overall requirement in other hours. Because the
12 dispatchable resource class is a net provider rather than a user of
13 regulation reserve service, its stand-alone regulation reserve requirement
14 is zero (or negative), and its share of the system regulation reserve
15 requirement is also zero.¹⁶

16
17 **Q. PLEASE RESPOND TO SIERRA CLUB WITNESS GOGGIN'S**
18 **CRITIQUE OF SERVM MODELING OF OPERATING RESERVES.**

19 **A.** Sierra Club Witness Goggin's statement that "SERVM only appears to rely
20 entirely on fast-acting spinning reserve to accommodate renewable variability" is
21 inaccurate. SERVM fully optimizes around all attributes of generators to address net
22 load variability including ramp rates, operating ranges, and capabilities to serve
23 various ancillary services including regulating reserves, spinning reserves, and non-
24 spinning reserves. During capacity constrained periods, spinning reserves and non-
25 spinning reserves are foregone to ensure peak demand is met and reliability is
26 maintained. Renewables are modeled as flexible in that the model curtails them
27 during overgeneration periods.

¹⁶ See PacifiCorp filing in FERC Docket ER17-219-000, at 7&8 available at <https://elibrary.ferc.gov/idmws/common/OpenNat.asp?fileID=14386396>

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 **Q. PLEASE RESPOND TO SIERRA CLUB WITNESS GOGGIN'S CLAIM**
2 **THAT SERVVM DOES NOT CAPTURE THE FAST START CAPABILITY**
3 **OF BATTERIES.**

4 **A.** This claim is also incorrect. The SERVVM model fully captures the fast start
5 capability of batteries by allowing modeled batteries to shift from fully charging
6 to dispatching instantaneously, with no constraints on the amount of cycles.
7 Conventional resources are modeled accurately with proper constraints including
8 minimum capability, ramp rates, minimum up and down times, start-up times, and
9 full heat rate curves. SERVVM's capability to model intra hour, system flexibility,
10 and capture the value of energy storage were the primary reasons PNM performed
11 additional modeling in SERVVM to support the Encompass modeling effort.

12
13 Witness Goggin's critique that models should be at a lower resolution than five
14 minutes should be rejected. The SERVVM five-minute modeling is appropriate to
15 capture the flexibility benefit of flexible resources, and I am not aware of any
16 common resource planning modeling tool that is utilized at a lower resolution to
17 model multiple years in the future.

18
19 **Q. PLEASE RESPOND TO SIERRA CLUB WITNESS GOGGIN'S CLAIM**
20 **THAT PNM DID NOT ALLOW GRID CHARGING FOR BATTERIES**
21 **PAIRED WITH SOLAR.**

22 **A.** In response to Mr. Goggin's Direct Testimony, Astrapé performed a sensitivity on
23 PNM Scenario 3 to understand the impact of restricting the hybrid battery projects

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 to grid charging. In PNM Scenario 3, it is assumed that all charging of batteries
2 in paired projects for the first five years must come from the associated solar. The
3 sensitivity removed the charging restrictions on hybrid solar-battery projects in all
4 hours, which would require the battery owner to forego all Investment Tax Credit
5 benefit, and the LOLE_{CAP} for 2023 only shifted modestly from 0.39 to 0.35 events
6 per year. In this sensitivity, the resulting cost increases from the loss of tax
7 credits would outweigh any potential benefit from this shift in the LOLE_{CAP}.

8
9 PNM witness Thomas Fallgren presents the energy storage agreements for the
10 Jicarilla and Arroyo storage projects, which describe the allowed operation of the
11 batteries, in his direct testimony.

12

13 **Q. PLEASE RESPOND TO SIERRA CLUB WITNESS GOGGIN'S**
14 **CRITIQUE OF CORRELATED GAS OUTAGES IN SERVUM.**

15 **A.** The correlated gas events that Sierra Club Witness Goggin references are rare and
16 expected to occur in the winter peak demand periods¹⁷ when PNM loads are lower
17 than in the summer. All of the LOLE_{CAP} in the SERVUM modeling occurs during
18 the summer months so it is unlikely that any additional risk in the winter
19 modeling would increase LOLE_{CAP}. PNM Witness Phillips addresses the risk of
20 correlated gas outages on PNM's system in more detail in his rebuttal testimony.

21

¹⁷ Goggin at 41 (“During several recent winter peak demand periods, gas generators have been forced offline by fuel supply limitations or interruptions.”)

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 More importantly, the data indicates correlated outages are a de minimis
2 occurrence on PNM's system historically. I have reviewed the gas generator
3 Generation Availability Data System data that Sierra Club Witness Goggin bases
4 his correlated outage claims on. Sierra Club provided the data in discovery. It
5 shows that only approximately twenty-five hours out of the last eight and half
6 years showed a common mode failure occurred across multiple generator
7 outages.¹⁸ This represents only 0.03% of all the hours. I note there is a
8 distinction between common mode failures and simply generators failing at the
9 same time due to independent causes, and that the SERVM modeling already
10 captures independent failures occurring across multiple units.

11
12 **Q. SIERRA CLUB WITNESS GOGGIN CLAIMS THAT PNM**
13 **INCORRECTLY ASSUMED THAT FLEXIBILITY OR CAPACITY**
14 **SHORTFALLS WILL NECESSARILY RESULT IN LOSS OF LOAD**
15 **EVENTS. HOW DO YOU RESPOND?**

16 **A.** Mr. Goggin is incorrect. Contrary to his assertion, solutions such as external
17 assistance and reducing operating reserves were utilized in the SERVM modeling
18 to mitigate loss of load events. A loss of load event due to capacity shortages,
19 defined as $LOLE_{CAP}$, occurs only after exhausting all generating resources,
20 including demand response resources, exhausting neighbor external assistance,

¹⁸ Afton and Luna CCs are already modeled as single units in SERVM so common mode failures across the gas CT and ST portion of a combined cycle were not and should not be included in this analysis.

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 and foregoing all spinning and non-spinning reserves similar to real time
2 operations.

3
4 Loss of load violations in the SERVVM model caused by flexibility, defined as
5 $LOLE_{FLEX}$, are mitigated by increasing online ramping capability within the unit
6 commitment to reduce these events. Similar to $LOLE_{CAP}$ events, all generating
7 resources including demand response resources, neighbor external assistance, and
8 spinning and non-spinning reserves were utilized. As discussed above in my
9 responses to CCAE Witness Milligan, $LOLE_{FLEX}$ as developed by Astrapé
10 provides a means of comparing portfolios to ensure system flexibility is
11 comparable across the different portfolios and was a metric that could be met by
12 all portfolios that contained the addition of flexible gas or battery in each of the
13 replacement resource portfolios.

14
15 **IV. RESPONSE TO SWG'S DIRECT TESTIMONY**

16 **Q. WHAT IS YOUR RESPONSE TO SWG WITNESS BABCOCK'S CLAIM**
17 **THAT SERVVM DOES NOT CONSIDER REACTIVE POWER FLOW,**
18 **VOLTAGE SAGS OR VOLTAGE SPIKES, SYSTEM INERTIA, OR**
19 **SYSTEM FREQUENCY AND PHASE ANGLE?¹⁹**

20 **A.** Capacity expansion and production cost models such as the EnCompass,
21 PowerSimm, and SERVVM models are not designed to examine reactive power

¹⁹ Babcock Direct at 21-22.

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 flow, voltage sags/spikes, system inertia, or system frequency and phase angle.

2 As explained by PNM Witness Thomas Duane, the assessment of these items is
3 accounted for in the transmission system impact studies that are performed before
4 interconnecting generation facilities to the transmission system.

5
6 **Q. WHAT IS YOUR RESPONSE TO SWG WITNESS BABCOCK'S CLAIM**
7 **THAT ASTRAPÉ'S RESULTS SHOW THAT A REPLACEMENT**
8 **PORTFOLIO WITH NO NEW GAS IS COMPETITIVE (WITHIN \$25-115**
9 **MILLION) AND AS RELIABLE AS PNM'S SCENARIO 1?²⁰**

10 **A.** The only no gas replacement portfolios mentioned by SWG Witness Babcock are
11 portfolios that did not adhere to the appropriate battery levels applied by PNM,
12 which assumed battery project sizes no greater than 40 MW and a total battery
13 capacity of 130 MW. These no gas replacement portfolios contain batteries that
14 are 150 MW and greater. However, even without applying the battery limitation,
15 these no gas portfolios are more expensive than PNM Scenario 1. As described in
16 my Direct Testimony, if PNM's battery limitations are not applied, then the
17 SERVM modeling identifies Tier 2-2 as the optimal portfolio which still contains
18 231 MW of gas, 170 MW of battery, and 350 MW solar. No party in this
19 preceding to my knowledge has identified a portfolio that is both reliable and less
20 expensive than PNM Scenario 1 and also adheres to the battery levels applied by
21 PNM.

22

²⁰ Babcock Direct at 56-63.

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 **Q. WHAT IS YOUR RESPONSE TO SWG WITNESS BABCOCK’S CLAIM**
2 **THAT ASTRAPÉ IMPOSED UNREASONABLE BATTERY**
3 **CONSTRAINTS IN ITS MODELING?²¹**

4 **A.** PNM Witnesses Kemp, Maestas and Fallgren have provided testimony supporting
5 PNM’s appropriate level of initial battery storage. As discussed above, Astrapé’s
6 analysis shows that even without battery limitations applied, the Pinon Gas Plant
7 should be part of the replacement resource portfolio to provide reliability and the
8 least cost replacement portfolio for customers. As demonstrated in PNM Exhibit
9 NW-2 to my Direct Testimony, the optimal level of initial battery deployment
10 supported in the SERVVM unconstrained battery analysis was 150MW - 170 MW.
11 The results of incorporating the 40 MW project size limitation was an economical
12 introduction of battery storage at 130 MW total, which aligns with PNM Witness
13 Kemp’s recommendation regarding limiting battery capacity to not more than 130
14 MW or approximately 5% of peak load (based on the Balancing Area load).

15

16

V. CONCLUSION

17 **Q. PLEASE SUMMARIZE THE CONCLUSIONS YOU HAVE REACHED IN**
18 **RESPONSE TO INTERVENOR TESTIMONIES.**

19 **A.** SERVVM complements the other modeling tools supporting PNM’s Consolidated
20 Application by providing important intra-hour modeling and the capability to
21 determine reliability from a capacity and flexibility standpoint in addition to

²¹ Babcock Direct at 53-55.

**REBUTTAL TESTIMONY
OF NICK WINTERMANTEL
NMPRC CASE NO. 19-00195-UT**

1 providing economics. PNM's SERVVM modeling assumptions were based on
2 available historical data and are reasonable for modeling purposes. The SERVVM
3 modeling in this case based on those assumptions demonstrates that PNM
4 Scenario 1 provides the best balance of economic and reliable resources that will
5 place PNM firmly on the path toward achieving a carbon free portfolio consistent
6 with the Energy Transition Act. The changes to and criticisms of the SERVVM
7 modeling assumptions by intervenors are unsupported by data and facts. Those
8 changes and assumptions made by intervenors lead to unreliable and more
9 expensive alternative portfolios than PNM's Scenario 1.

10

11 **Q. DOES THIS CONCLUDE YOUR REBUTTAL TESTIMONY?**

12 **A.** Yes, it does.
